System Characteristics

Source match (without system error correction)	> 19 dB (n.trc.) ¹ , typ. >30dB
Directivity (without system error correction)	> 23 dB (n.trc.) ¹ , typ. >30dB
Dynamic Range [dB]	> 100, typ. 110

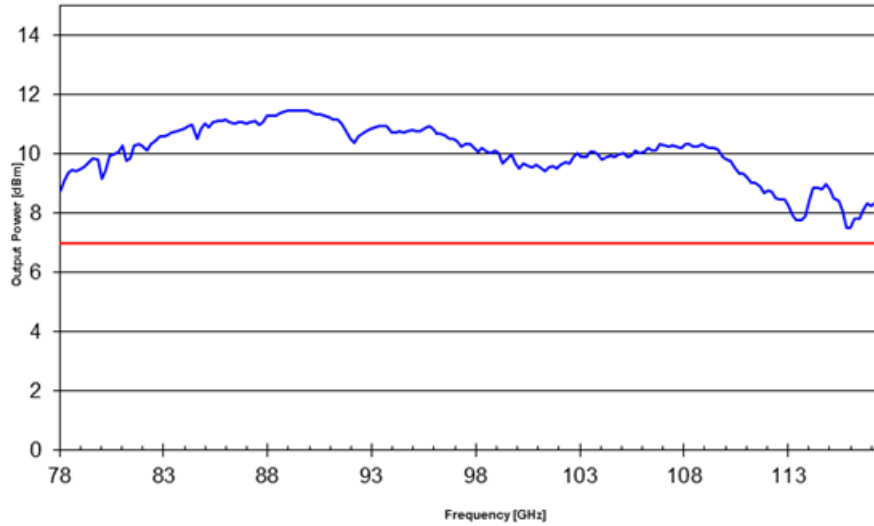

Dynamic range is defined as the difference between the data trace of the transmission magnitude with maximum test port output power and both test ports through-connected on the one hand and the RMS value of the data trace of the transmission magnitude produced by noise and crosstalk with test ports short-circuited on the other. The specification is valid without system error correction and at 10Hz measurement bandwidth. The dynamic range can be increased by using a measurement bandwidth of 1Hz.

¹ Without consideration of measurement uncertainty.
